HIGHLIGHTS OF 1967

The general level of molasses prices in the United States during 1967 averaged well above that of the previous year. The high cost of imported molasses and a continued good demand from the livestock feeding industry provided the major strengthening influences on domestic molasses prices. Although prices early in the year reached their highest points in about four years, closing prices generally ranged from 3/4¢ to 1.6¢ per gallon below the end of 1966.

The relationship between the cost of molasses and the cost of corn was less favorable for molasses in 1967 than in 1966.

Molasses available for feed and industrial use in the United States during 1967 was estimated at 700 million gallons. This was six percent more than the year before and second only to the record 721-million-gallon supply available in 1960. A rise in imports of molasses accounted for most of the increase in 1967 supplies. Domestic sources provided only a little more molasses than the previous year, while shipments from Hawaii and Puerto Rico ran slightly smaller. Mexico remained the United States' largest foreign supplier of molasses, furnishing a record 130 million gallons. A third of the total molasses imported into this country from all foreign suppliers came through the New Orleans Customs District. Exports of molasses from the United States during 1967 dropped 25 percent below the year before. Most molasses exports were made from Puerto Rico and went, as usual, to Canada, the United Kingdom, and the Netherlands.

The quantity of molasses used in the manufacture of distilled spirits in the United States during 1967 showed a sharp increase. In fact, its use for this purpose was the heaviest since 1960. Other industrial uses, however, were little changed from the year before. The amount of molasses available for livestock feed in 1967 was 519 million gallons -- the most since 1960.

PRICESCane Molasses

Prices of cane molasses -- continuing an upward trend that started in the autumn of 1965 -- advanced further during the first two months of 1967 when demand from feeders, ranchers, and feed manufacturers was seasonally heavy. Prices held relatively steady through April, and then began a gradual but steady decline throughout the remainder of the year.

Except for the seasonal summer lull, demand for molasses was generally good in 1967. Molasses lost some of its price advantage in relation to corn as corn prices came down faster than molasses prices.

Cane molasses prices at the close of the year ran 3/4¢ to 1.6¢ per gallon below a year earlier at most terminals. East Coast markets registered the least downturn of any area in the country. This was largely a reflection of continued strong competition in the East and the general trade practice of granting price discounts (usually 1/2¢ per gallon) to "volume users." Some of the sharpest losses appeared at Mississippi River terminals and in the Midwest.

MOLASSES PRICES

F.O.B. Tank Car, New Orleans

U. S. DEPARTMENT OF AGRICULTURE

NEG. C&MS 18-68 (3)

CONSUMER AND MARKETING SERVICE

Differentials, or the price relationships, between New Orleans and other major molasses terminals in 1967 were not much different from those of 1966. In fact, the closing price of molasses in South Florida was on a par with New Orleans. The spread between the price of molasses at New Orleans and Houston, Corpus Christi, Mobile, and the West Coast was only 1/2¢ per gallon at the close of the year. The spread ran 1¢ per gallon at all East Coast terminals from Savannah to New York, and stood at 1.5¢ in Boston and Albany. The difference between the New Orleans price and prices at most Midwestern markets ranged anywhere from 3-1/2¢ to about 6-1/4¢ per gallon.

Beet Molasses

Prices of beet molasses remained steady throughout the year. This reflected, to a large extent, the common practice in the sugar beet area of selling a large part of the beet molasses production on yearly contractual arrangements. Although prices were unchanged on a month-to-month basis and closed out 1967 at the same level as 1966, the year's average price was higher than the previous season. This was due to the fact that prices rose rapidly in 1966, and 1967 prices held at the high level reached at close of 1966. The 1967 average price went up \$3.84 per ton in Colorado, Wyoming, and Montana, and \$3.30 per ton in Oregon, Utah, and Idaho.

Citrus Molasses

The market for citrus molasses held up well in 1967 despite a record-breaking output of citrus molasses. Prices remained steady at \$16.00 to \$18.00 per ton throughout the year, with most sales made at the top of the range. Although the closing market was only \$1.00 per ton above the year before, the 1967 average price stood \$2.35 higher than a year earlier.

Corn (Hydrol) Molasses

Prices of corn molasses followed an uneven trend -- advancing the first two months of 1967, holding relatively stable the next eight months, and then declining the last two months of the year. Even so, the general level of corn molasses prices stood well above that of the previous season. The downturn late in the year left closing prices slightly under the previous year's close. However, the 1967 average price was about \$9.00 per ton above the 1966 average in Chicago and \$7.50 higher in Kansas City as the upturns early in 1967 were sufficient to more than offset the generally low prices prevailing in the first half of 1966.

The quantity of corn molasses used in livestock feed continued to decrease, while the amount used by various manufacturing outlets -- particularly the pharmaceutical industry -- showed a further increase. This reflected, to a great extent, the comparatively high cost of corn molasses in relation to cane molasses and the suitability of corn molasses to certain industrial uses.

1/ A "rule of thumb" measure-- 6-1/2 gallons of molasses are about equivalent in carbohydrate value to one bushel of corn -- is widely used to compare the carbohydrate value of molasses and corn. This measure is based on experiments conducted to evaluate the energy produced from one bushel of corn and the amount of molasses required to produce the same amount of energy.
